Property Assessment Re-indexer API – Documentation

Property Assessment Re-indexer API – Documentation

This script is used for extracting, enriching, transforming, and indexing property assessment data from eGov services into an Elasticsearch cluster. It is tailored for a municipal property assessment use case, allowing for large-scale, parallel data processing and enrichment across multiple municipal tenants.

Prerequisites

- Python version: Python 3.7 or newer is recommended, as the script uses features (like type hints and ThreadPoolExecutor) available in recent Python releases.
- **Required packages**: You must have the following Python packages installed:
  - requests
  - urllib3
  - Standard library modules: json, time, logging, datetime, uuid, threading, concurrent.futures, typing

    Command: pip install requests urllib3

Configuration

All runtime configuration is controlled through the Python dictionary named config. You should update the following keys based on your deployment:

Step 1. CREATE THE NEW INDEX

```
PUT property-assessments-temp
        {
          "mappings": {
              "general": {
                "properties": {
                  "Data": {
                    "properties": {
                      "@timestamp": {
                        "type": "date"
                      },

      "type": "keyword",
      "ignore_above": 256
    }
  }
},
"street": {
  "type": "text",
  "fields": {
    "keyword": {
      "type": "keyword",
      "ignore_above": 256
    }
  }
},
```

```
                "tenantId": {
                  "type": "text",
                  "fields": {
                    "keyword": {
                      "type": "keyword",
                      "ignore_above": 256
                    }
                  }
                }
              }
            }
          }
        }
      }
    }
  }
}
```

Step 2. Download the Script file propert_assessment.py in your local machine

Command:

curl -o propert_assessment.py https://raw.githubusercontent.com/pmidc-digit/mSevaUPYOG/PMIDC_EGOV_FIXES/utilities/re-indexScript/propert_assessment.py

Step 3. Update the services url and parameter

- List of tenant codes to process. **Note**: Here you need to replace all unique tenant id's.

  Example:

```
tenant_ids = [
    'pb.ahmedgarh',
    'pb.jalandhar',
    'pb.ludhiana',
    'pb.mohali',
    'pb.patiala']
```

- Index_name

  Name of the Elasticsearch index to which is created in step 1.

  Here you have to change:

https://github.com/pmidc-digit/mSevaUPYOG/blob/76afdb1b936bf17046d3a609541702f873d8ea53/utilities/re-indexScript/propert_assessment.py#L35

- FROM_DATE and TO_DATE (Optional)

  Millisecond epoch timestamps controlling the date range of fetched assessments.

  Example:

  ```
  FROM_DATE = 1743465600000
  TO_DATE = 1758153600000
  ```

Step 4. Copy the updated script to the playground

Open the terminal where file is there

Command:

kubectl cp propert_assessment.py playground/playground-8654d8cf66-clbd5:/tmp

Step 5. Enter in the pod

Command:

kubectl exec -it -n playground playground-8654d8cf66-clbd5 -- /bin/bash

Step 6. Run the script with command:

cd /tmp
python3 propert_assessment.py

Step 7: Re-index Data in Elasticsearch

After validation, copy data from the temp index into the main index:

```
POST _reindex
{
  "source": { "index": "property-assessment-temp" },
  "dest": { "index": "property-assessment" }
}
```

//Check the database credentials and update based on production or uat. We can run this script inside the playground pod also. Other option is portforward the indexer service and run the script.

Time taken: 396 seconds (6.6 minutes)

Property Service Re-indexer API – Documentation

Property Service Re-indexer API – Documentation

This script is used for extracting, enriching, transforming, and indexing property service data from eGov services into an Elasticsearch cluster. It is tailored for a municipal property service use case, allowing for large-scale, parallel data processing and enrichment across multiple municipal tenants.

Prerequisites

- Python version: Python 3.7 or newer is recommended, as the script uses features (like type hints and ThreadPoolExecutor) available in recent Python releases.
- **Required packages:** You must have the following Python packages installed:
  - requests
  - urllib3
  - Standard library modules: json, time, logging, datetime, uuid, threading, concurrent.futures, typing

    Command: pip install requests urllib3

Configuration

All runtime configuration is controlled through the Python dictionary named config. You should update the following keys based on your deployment:

Step 1. CREATE THE NEW INDEX

PUT property-services-temp

                  "ignore_above": 256
                }
              }
            }
          }
        }
      }
    }
  }
  }
}
```

Step 2. Download the Script file [property_indexer_api.py]() in your local machine

Command:

curl -o property_indexer_api.py https://raw.githubusercontent.com/pmidc-digit/mSevaUPYOG/PMIDC_EGOV_FIXES/utilities/re-indexScript/property_indexer_api.py

Step 3. Update the services url and parameter

- List of tenant codes to process. **Note**: Here you need to replace all unique tenant id's.

Example:

```
tenant_ids = [
    'pb.ahmedgarh',
    'pb.jalandhar',
    'pb.ludhiana',
    'pb.mohali',
    'Pb.patiala']
```

- Index_name

  Name of the Elasticsearch index to which is created in step 1.

  Here you have to change:

https://github.com/pmidc-digit/mSevaUPYOG/blob/76afdb1b936bf17046d3a609541702f873d8ea53/utilities/re-indexScript/property_indexer_api.py#L37

- FROM_DATE and TO_DATE

  Millisecond epoch timestamps controlling the date range of fetched services.

  Example:

```
FROM_DATE = 1743465600000
TO_DATE = 1758153600000
```

Step 4. Copy the updated script to the playground

Open the terminal where file is there

Command:

kubectl cp property_indexer_api.py playground/playground-8654d8cf66-clbd5:/tmp

Step 5. Enter in the pod

Command:

kubectl exec -it -n playground playground-8654d8cf66-clbd5 -- /bin/bash

Step 6. Run the script with command:

```
cd /tmp
python3 property_indexer_api.py
```

Step 7: Re-index Data in Elasticsearch

After validation, copy data from the temp index into the main index:

```
POST _reindex
{
  "source": { "index": "property-services-temp" },
  "dest": { "index": "property-services" }
}
```

Time taken: 4931.57 seconds (82.2 minutes)

Payment Re-indexer API – Documentation

Payment Re-indexer API – Documentation

This script is used for extracting, enriching, transforming, and indexing payment data from eGov services into an Elasticsearch cluster. I

Prerequisites

- Python version: Python 3.7 or newer is recommended, as the script uses features (like type hints and ThreadPoolExecutor) available in recent Python releases.
- **Required packages**: You must have the following Python packages installed:
  - requests
  - urllib3
  - Standard library modules: json, time, logging, datetime, uuid, threading, concurrent.futures, typing

    Command: pip install requests urllib3

Configuration

All runtime configuration is controlled through the Python dictionary named config. You should update the following keys based on your deployment:

Step 1. CREATE THE COPY OF INDEX

Note: The index name **must be set to** `"paymentsindex-v1"` because this is the index expected and required by the **DSS (Dashboard System Service)** for the **collection module**.

So, make the copy of the initial **`paymentsindex-v1 index:`**

`Command:`

```
POST _reindex
{
  "source": { "index": "paymentsindex-v1" },
  "dest": { "index": "paymentsindex-v1-temp" }
}
```

And also make the copy of the initial **dss-collection_v2:**

```
POST _reindex
{
  "source": { "index": "dss-collection_v2" },
  "dest": { "index": "dss-collection_v2-temp" }
}
```

Step 2. DELETE THE INDEX

Command:

DELETE `paymentsindex-v1`

DELETE **dss-collection_v2**

Step 3. CREATE THE NEW INDEX

First index

PUT paymentsindex-v1

```

        "type": "text",
        "fields": {
          "keyword": {
            "type": "keyword",
            "ignore_above": 256
          }
        }
      },
      "name": {
        "type": "text",
        "fields": {
          "keyword": {
            "type": "keyword",
            "ignore_above": 256
          }
        }
      }
    }
  }
}
"identifier": {
  "type": "text",
  "fields": {
```

```
            "keyword": {
              "type": "keyword",
              "ignore_above": 256
            }
          }
        }
      }
    }
  }
}
```

Step 4. Create alis by this command

```
POST _aliases

{

  "actions": [

    {

      "add": {

        "index": "egov-dss-ingest-enriched",

        "alias": "dss-collection_v2"

      }

    }

  ]

}
```

Step 5. Download the Script file payment-index.py in your local machine

Command:

curl -o payment-index.py https://raw.githubusercontent.com/pmidc-digit/mSevaUPYOG/PMIDC_EGOV_FIXES/utilities/re-indexScript/payment-index.py

Step 6. Update the services url and parameter

- List of tenant codes to process. **Note**: Here you need to replace all unique tenant id's.

  Example:

  ```
  tenant_ids = [
      'pb.ahmedgarh',
      'pb.jalandhar',
      'pb.ludhiana',
      'pb.mohali',
      'pb.patiala']
  ```

- Index_name

  Name of the Elasticsearch index to which is created in step 1.

  Here you have to change:

  https://github.com/pmidc-digit/mSevaUPYOG/blob/76afdb1b936bf17046d3a609541702f873d8ea53/utilities/re-indexScript/payment-index.py#L35

- FROM_DATE and TO_DATE (Optional)

  Millisecond epoch timestamps controlling the date range of fetched assessments.

  Example:

  ```
  FROM_DATE = 1743465600000
  ```

```
TO_DATE = 1758153600000
```

- BUSINESS_SERVICES

  Filtered by business service

  Example: BUSINESS_SERVICES = {'PT'}

Step 4. Copy the updated script to the playground

Open the terminal where file is there

Command:

kubectl cp payment-index.py playground/playground-8654d8cf66-clbd5:/tmp

Step 5. Enter in the pod

Command:

kubectl exec -it -n playground playground-8654d8cf66-clbd5 -- /bin/bash

Step 6. Run the script with command:

cd /tmp
python3 payment-index.py

//Check the database credentials and update based on production or uat. We can run this script inside the playground pod also. Other option is portforward the indexer service and run the script.

Time taken: 1.87 seconds (for PT service)

Tab 4

```
DELETE property-services-enriched/_mapping
